Write up #2

Jonathan Rivera Chico

Bandit

1. Very easy exercise, just had to use cat in a file in the directory.
2. This exercise required me to read a dash file in the home directory, which was read differently by using cat < -.
3. In this problem, a new file name "spaces in the namefile" appeared and the flag was inside, to read it, just type cat "spaces in the namefile".
4. The file that contained the flag was inside a folder which had a hidden file, to see the name type ls -a to see the hidden files which was hidden.
5. Several files with dashes on their name, had to read a couple of file to find the only human readable one which was the -file07.
